ALLERGENIC EXTRACT,
PRESCRIPTION PRODUCT
SUBLINGUAL IMMUNOTHERAPY
(SLIT)

FOR ANIMAL DESENSITIZATION
RESTRICTED TO USE BY OR UNDER THE
SUPERVISION OF A VETERINARIAN

Contains phenol (0.4%) as a preservative
Contains 50% glycerin

HANDLING ADVERSE REACTIONS IF OBSERVED

Animals should be observed for at least 30 minutes following
dosing. Possible systemic reactions to watch for are: increased
itching, vomiting and/or diarrhea, and hives. The possibility of
this type of anaphylactic reaction is remote. However, if such a
reaction occurs, it may be advisable to administer epinephrine
to the animal. For the average size dog, inject 0.2 to 0.5 ml of
epinephrine 1:1000 w/v. Mild reactions may be controlled with
antihistamines.

INDICATIONS AND USAGE:

Keep treatment sets refrigerated at 2-7°C. Do not freeze. Sublingual
allergenic extract is given by spraying in the mouth, between the
cheek and gums. The animal should be observed for 30 minutes
following dosing. Each animal’s treatment schedule should be
determined during the course of therapy by observing the degree
of sensitivity the animal presents. The following dosage schedule
serves as a guideline. The dose actually used should always be
determined by your veterinarian.

The suggested dosage of sublingual spray is based on body weight.
Each “squir” (a full depression of the spray cap) delivers 0.1 ml
of the allergenic extract. As a precaution, the first dose may be
administered under veterinary supervision. For animals with
distinctly seasonal signs, beginning therapy 2-3 months prior to the
allergy season may prove beneficial. When used in Equines, the
withdrawal period is 21 days.

ADMINISTERING TWO TREATMENTS TO ONE
ANIMAL

Use the same schedule, administering the recommended
amount for each set, preferably at different sites in the
animal’s mouth.

DOSAGE SCHEDULE
